Note that the KW and Amps are controlled by the setting on the Power Mode.

Check specifications on unit used. Voltage, amperage, breaker and wire may vary depending on local electrical standards. Consult a professional plumber or electrician for guidance.

The electrical specifications are based on 220 volts. It should be noted that higher voltage will increase power, just as lower voltage will have the reverse effect. The (POWER MODE CONTROL) can be adjusted to compensate allowing the user to increase or decrease water temperature. For best performance adjust temperature at MEDIUM FLOW (approximately 1 GPM) this is the average water flow at any faucet with an aerator.

Remember, that any adjustments made on your unit will take seconds to reach point of use. DO NOT OVER HEAT WATER. Water temperature from 105F to 120F is adequate for all practical purposes
